

Hyperlink based campaigns

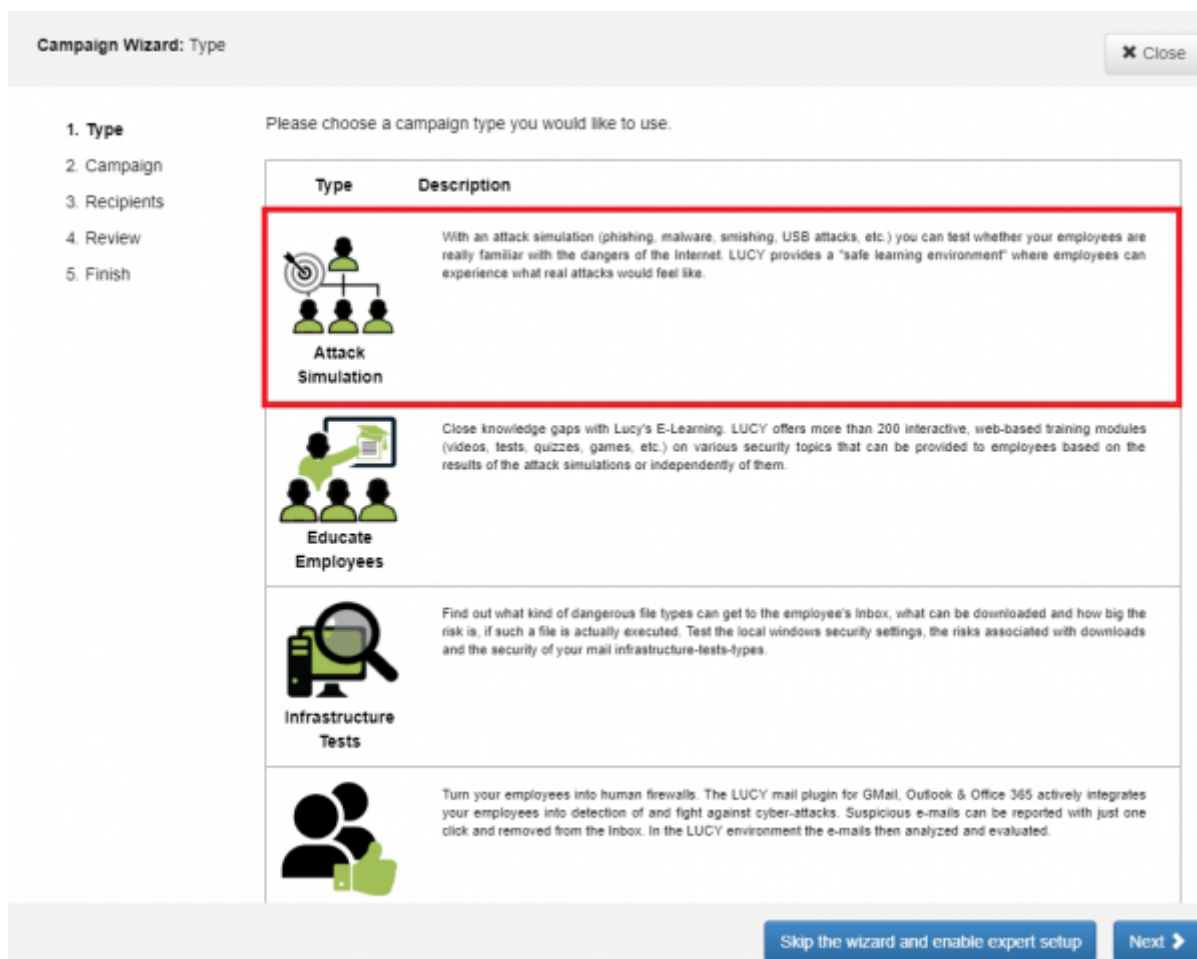

A hyperlink based campaign will send users a mail with a randomized tracking URL within the mail. If users click that hyperlink they get redirected to an external webpage which needs to be defined within the campaign. As a result a hyperlink only campaign does not contain a webpage hosted on LUCY, it only contains a message template (mail or SMS) which a hyperlink.

To start a "hyperlink campaign" go through the following steps:

- Press "New Campaign".

- Select Attack Simulation, click "Next" button.

- Select Hyperlink attack, click "Next" button.

8. Finish

Please choose an attack simulation type you would like to use.

**Data Entry Attack**

Data entry attack can include one or more web pages that intercept the input of sensitive information. The available web pages can be easily customized with a LUCY web editor. Additional editing tools allow you to quickly set up functions such as log-in forms, download areas, etc. without HTML knowledge.

**Hyperlink Attack**

A hyperlink-based attack will send users an e-mail that contains a randomized tracking URL to identify the user who clicked the link. There is no landing page involved in this campaign type. But you can redirect the user to any webpage after he clicked the link.

**File Attack**

File-based attacks allow the LUCY administrator to integrate different file types (office documents with macros, PDFs, executables, MP3s, etc.) into mail attachments or websites generated on LUCY and to measure their download or execution rate.

**Portable Media Attack**

LUCY offers the option to perform portable media attacks where a file template (e.g., executable, archive, office document with macros, etc.) can be stored on a portable media device such as USB, SD card, or CD. The activation (execution) of these individual files can be tracked in LUCY.

**Smishing**

Smishing is, in a sense, "SMS phishing." When cybercriminals "phish," they send fraudulent e-mails that seek to trick the recipient into opening a malware attachment or clicking on a malicious link. Smishing simply uses text messages instead of e-mail.

Skip the wizard and enable expert setup

Redirection in hyperlink based campaigns

In case nothing has been defined in the redirect field in the campaign, the recipient would be redirected to the Google main page once the hyperlink has been press in the campaign. This is expected and it means that the link actually works.

The common redirection to be used with a hyperlink phishing simulation is the awareness webpage. To use this go to *Campaign > Attack Settings > Edit Scenario Settings* and insert into the field "Redirect ULR" the value:

%awareness%
