

## Background Info

The user reputation level is a score that gives every user a specific profile based on the number of successful phishing simulations performed against this use. If a user gets 2 phishing simulations and falls for one of them, the level will be 1.

## Configuration

The profiles can be configured under the according menu in the settings:

You can create different profiles. Each profile can have its own settings which are used to determine, what the reputation type is:

Reputation Levels			
Reputation Level	Rating	Attacks	
Average	20%	4	✖
Houston - we got a problem	100%	5	✖
Expert	0%	5	✖
Noob	50%	2	✖

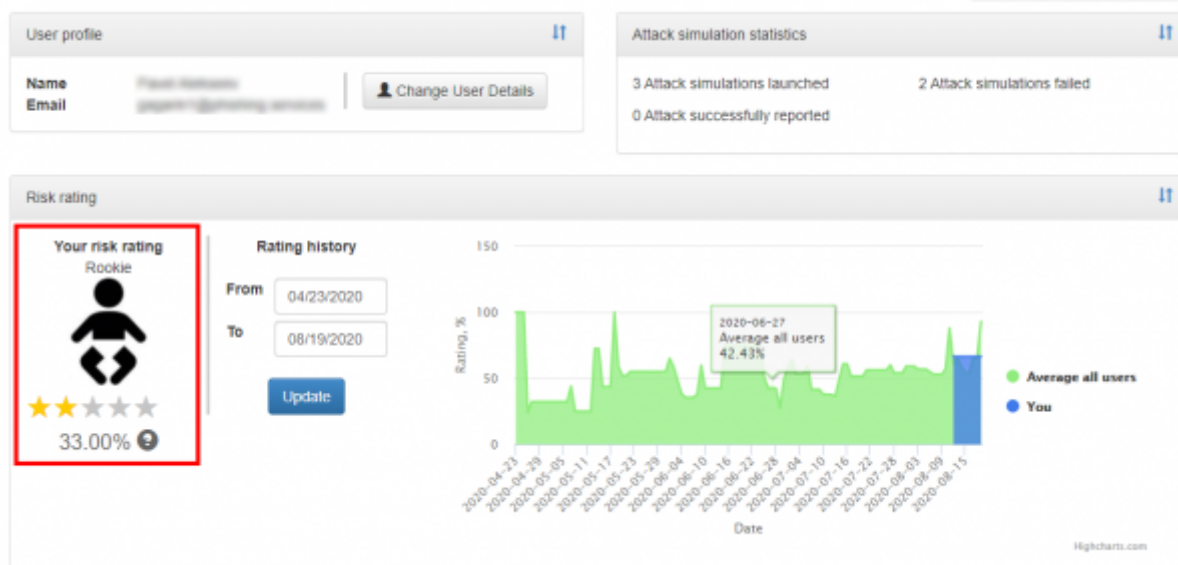

The reputation profile also allows you to use a picture (100 x 100 px).

[Home](#) / [Reputation Levels](#) / Rookie

# Rookie

Name Min. Number of Attacks Min. Rating, % Icon  No file chosen

This picture will then appear on the statistics recipient page as well in the awareness end user section:
