

Within the scenario Settings of a Campaign, the administrator can determine whether the data (this is any data received from the user within a form) transferred in Web forms is saved.

The screenshot displays the 'Scenario Settings' page for a campaign named 'Demo Baseline - Scenario'. The interface includes a sidebar with navigation links and a main settings area. The 'Collect Data' dropdown menu is highlighted with an orange box, showing three options: 'Full' (selected), 'No', and 'Partial'. Other settings include 'Landing Domain' (cloudspace365.solutions), 'Subdomain' (office365), 'Languages' (English), and checkboxes for 'Anonymous Mode', 'Track Opened Emails', and 'Send Link to Awareness Website Automatically'. There are also input fields for 'Send Awareness By Click Rate', 'Send Awareness By Success Rate', and 'Awareness Delay'. The 'Success Action' is set to 'Data Submit'. The 'URL Shortener' is set to 'Full'. The 'Login Regexp' field is empty. An 'Insert' button is located at the bottom right.

There are 3 methods:

- **Full:** Choose "Full" if you want to record all entered logins and passwords
- **Partial:** Choose to record only the first 3 letters (remaining letters will be masked with asterisks) or
- **No:** Choose to skip user data collection
