

Within the scenario Settings of a Campaign, the administrator can determine whether the data (this is any data received from the user within a form) transferred in Web forms is saved.

The screenshot displays the 'Scenario Settings' page. On the left, a sidebar contains navigation links: Summary, Scenario Settings (highlighted), Mail Settings, SSL Settings, Landing Page Template, Message Template, and Errors. The main area is divided into sections: 'Template' (Outlook to Office365 Migration / English), 'Name' (Demo Baseline - Scenario), 'Landing Domain' (cloudspace365.solutions), 'Subdomain' (office365), and 'Languages' (English). Below these are checkboxes for 'Anonymous Mode', 'Track Opened Emails', and 'Send Link to Awareness Website Automatically'. There are also input fields for 'Send Awareness By Click Rate' and 'Send Awareness By Success Rate', both set to 0%. An 'Awareness Delay' field is set to 0. There are checkboxes for 'Advanced Information Gathering' and a 'Success Action' dropdown set to 'Data Submit'. A 'Collect Data' dropdown menu is open, showing options: Full, No, Partial, and Full. The 'URL Shortener' dropdown is set to 'Full'. At the bottom, there is a 'Login Regexp' field and an 'Insert' button.

There are 3 methods:

- **Full:** Choose “Full” if you want to record all entered logins and passwords
- **Partial:** Choose to record only the first 3 letters (remaining letters will be masked with asterisks) or
- **No:** Choose to skip user data collection
