

Create a Phishing Campaign with Double Barrel Attack

When using Double Barrel Attack, the system first sends a “Lure” email containing some teaser text. After that, the system waits for a while (you can configure that time in settings below) and sends an actual phishing email. The “Lure” delay defines, in seconds, the time frame between the Lure and the attack emails for a Double-Barrel Attack.

To configure the LURE attack, please enable the options in the scenario settings:

The screenshot displays the 'Scenario' configuration page. On the left, a sidebar menu includes 'Summary', 'Scenario Settings' (highlighted with an orange box), 'Mail Settings', 'SSL Settings', 'Landing Page Template', 'Message Template', and 'Errors'. An orange arrow points from the 'Scenario Settings' menu item to the 'Double Barrel Attack' section in the main settings area. The main settings area is titled 'Scenario' and shows a status of 'Running'. It includes fields for 'Template' (Citrix Login / English), 'Name' (Scenario), 'Landing Domain' (cloudspace365.com), 'Subdomain' (test), and 'Languages' (English). Below these are checkboxes for 'Anonymous Mode', 'Track Opened Emails', and 'Send Link to Awareness Website Automatically'. There are also input fields for 'Send Awareness By Click Rate', 'Send Awareness By Success Rate', and 'Awareness Delay'. The 'Success Action' is set to 'Data Submit'. The 'Collect Data' section is highlighted with an orange box and contains the 'Double Barrel Attack' checkbox (checked) and the 'Lure Delay' input field (set to 0).

Once enabled, you can configure the lure template in the settings to the left:
