

Background Info

Lucy can create phishing scenarios where you ask the user to login on a landing web page. Some users might use some fake login data or login without any credentials on your phishing simulation. As you don't want those users to count as successful attacks you can define regular expressions within the login field. Those filters enable you to define the login criteria's. A login criteria could be:

- A password has to be contain at least two alphanumerical characters
- A username has to contain at least a certain domain name
- Etc.

Syntax used in the login fields on the web page

LUCY is recording ALL data send back to the landing page in a form POST request. But in order for LUCY to apply regular expressions in a login field the the login form should use a POST method and set the login action to "?login", you also need to set the name of the login field to "login" and the name of the password field to "password". A valid login field on LUCY where regular expressions can be applied might look like this:

```
<form action="?login" class="login-form" method="post" name="login-form">
<div class="content"><input class="input username" name="login"
placeholder="Username" type="text" />
<input class="input password" name="password" placeholder="Password"
type="password" />
<div class="footer"><input class="button" name="submit" type="submit"
value="Login" /></div>
</form>
```

Where to configure the login filters

Once you configured the login fields with the correct naming convention LUCY will be able to apply the filter mechanism which can be defined under scenario settings:

The screenshot shows the 'Scenario Settings' page. The left sidebar has 'Scenario Settings' highlighted. The main content area includes fields for Template (Encrypted Mail / English), Name (Access), Domain (phishing.services), Subdomain (login), Languages (English), and several checkboxes for features like Use SSL, Anonymous Mode, Track Opened Emails, Send Link to Awareness Website Automatically, and BeEF Information Gathering. At the bottom, there are fields for Success Action (Data Submit), Collect Data (Partial), and Double Barrel Attack. The 'Login Regexp' field contains 'lw.*lw' and the 'Password Regexp' field is empty. Both fields have an 'Insert' button next to them. A red box highlights the 'Login Regexp' and 'Password Regexp' fields and their respective 'Insert' buttons.

You have a list of existing filter examples in the dropdown menu to the right. If you don't find the correct filter in that menu you can apply any POSIX regular expression filter within those input fields (https://en.wikibooks.org/wiki/Regular_Expressions/POSIX_Basic_Regular_Expressions).

This close-up shows the 'Login Regexp' field with the value 'lw.*lw' and the 'Password Regexp' field which is empty. A dropdown menu is open next to the 'Login Regexp' field, displaying a list of filter examples: 'at least 2 alphanumerical values', 'at least 6 letters', 'at least 6 chars, min 1 digit', '6 chars, min 1 digit, min 1 symbol', '8-25 chars, min 1 digit, starts with a letter', and 'starts with "user", ends with 3 digits'. A 'Save' button is visible below the fields.

JavaScript based Login filters

Here is an example of a JS-based login function, which will:

- Verify if the username starts with certain letters
- verify if the password is complex

If 1) & 2) are verified, the script will send some fake login data to LUCY that allows the admin to verify, if real data has been entered.

SAMPLE HTML Code:

```
<html>
<body>
<form action="?login" method="post">
<div><input id="inp_user" maxlength="127" name="login" size="30"
title="Enter user name" type="text" width="180px" /></div>
<div class="right"><input id="passwd" maxlength="127" name="password"
size="30" type="password" width="180px" /></div>
</div>
<div class="right"><input id="Log_On" onclick="return checkPwd();"
type="submit" value="Submit" /></div>
</div>
</form>
<script type="text/javascript"
src="/public/campaign/XXX/jquery-1.11.3.min.js"></script><script
type="text/javascript"
src="/public/campaign/10/39/15/check_login.js"></script>
</body>
</html>
```

JS Libraries:

[Download the according JS libraries](#)

here

and place them within your campaign template (landing page).
