Simultaneous attack template usage (activation/deactivation)

LUCY gives you the option to use multiple simulated attack templates in a single campaign. Combine different types (hyperlink, file based etc) with different attack themes to achieve the largest possible risk coverage and a better understanding of employee vulnerabilities. Combined with our scheduling randomizer, complex attack patterns can be executed over a longer period of time.

If you add multiple scenario templates to your campaign, you see them listed in your base settings at the bottom. If you do not want to use a scenario within a campaign temporarily, you can deactivate it instead of deleting it. This is done by selecting the appropriate checkbox. Please save the changes after you have made your selection.
