IPS/IDS

Any LUCY instance can be optionally hardened with the additional security system.

Suricata IPS/IDS
IDS (Intrusion Detection System)
IPS (Intrusion Prevention System)

In comparison to the traditional layers of protection: antiviruses, spam filters and firewalls, the **IDS / IPS** provide a much higher level of network protection.

IDS works by identifying threats based on traffic analysis.
Traffic analysis is carried out according to pre-compiled rules. Both external repositories with rules for detecting the most common attacks and rules prepared at the request of the client for detecting incidents based on specific characteristics are used.

The IPS/IDS can be implemented into VPS or on-premise linux-based system by request.
Contact us via support@lucysecurity.com.
Please note, the ssh access would be required for this feature.
