

## Introduction

LUCY offers a role-based access control (RBAC), restricting system access to authorized users. The permissions to perform certain operations are assigned to specific roles within the user settings. Members or staff (or other system users) are assigned particular roles, and through that role, assignments acquire the computer permissions to perform particular LUCY functions.

## Where can you configure the user settings?

In LUCY you will find the user settings under "Settings/Users":

## Is there a limitation on how many users can access LUCY?

No. You have the ability to create as many LUCY users that can access the web console as you want.

## What are the different user roles?

- **User:** this user role created by the admin user can be given individual rights for each LUCY feature. The user can later be added to a specific campaign.

- **Supervisor:** Maintain the overview with access to the campaign specifications. Communicate directly with the campaign creator (user) to suggest changes and give approval to green light the campaign. The supervisor is in the hierarchy above the user. Therefore it is not possible to

supervise a system admin. The Supervisor is technically the same as the user account, but you may assign users to the supervisor account and approve/reject their campaigns. Within the settings you can select which users you want to supervise:

☒ Send Logs

☒ Service Logs

☒ Changelog

**Supervised Users**

☐ SergeUser

☐ Serge

☐ Nolan

Save

You have the ability to define a supervisor who is able to START/STOP the campaign which was created by a user. To do so add a user to a campaign with all permissions selected, add his supervisor to the same campaign with "Campaign start/stop" permission selected. As a result, the supervisor will only be able to go into the campaign and approve or reject the start.

- **Administrators:** The LUCY admin can save all settings within LUCY and run the campaign. This is the user that you need to perform your awareness campaigns. You cannot segregate administrators in a way, that an admin A doesn't see the clients from an admin B. This can only be done in the LUCY SaaS edition.
- **View Only Users:** The View Only User can only see certain statistics of the campaign. This user cannot start/stop a campaign. The user also has no rights in viewing or changing any of the campaign settings. First, you need to create a client name. The client name is always associated with a campaign. Then you can associate that user with the client. As a result, the View Only User will only see all the campaigns which belong to that specific client.

## How to convert users to LDAP-based?

Lucy has the ability to convert the account to LDAP-based, so existing user can be logged in through LDAP. You can convert multiple accounts at once by selecting the necessary users and clicking the button "Convert to LDAP-based":

Note: Lucy admin should configure the connection to Active Directory service to be able to use this feature. Please find more information about LDAP Integration [here](#).

## Can I enforce a password policy or strong authentication?

Yes. It is possible to adjust password policy in the advanced settings. Please find more [here](#).

## Can I authenticate administrative users via SSO?

Yes. It is possible using the AD Federation service and authenticate the users automatically. See [chapter SSO](#).

## How to set up a multitenant capable administration

To set up a multitenant capable administration, you first need an administrator account. From there you can set up the appropriate users and rights. Here are two use cases and the corresponding configuration:

**Use case 1:** You create a campaign for your customer, but want to give your customer access to the statistics within the campaign. It must be ensured that the customer only sees his own data and cannot intervene in the campaign configuration.

The image consists of two screenshots from the Lucy Security web application, illustrating a workflow for managing users and campaigns.

**Top Screenshot:** Shows the 'View' user profile page. The 'Client' dropdown is highlighted with an orange box and labeled '1'. An orange arrow points from this box to the 'Add User' button in the 'TEST (1)' campaign configuration page.

**Bottom Screenshot:** Shows the 'TEST (1)' campaign configuration page. The 'Client' dropdown is highlighted with an orange box and labeled '2'. An orange arrow points from this box to the 'Base Settings' button. Another orange arrow points from the 'Base Settings' button to the 'Permissions' section, where four permissions are highlighted with orange boxes and labeled '4': 'Create/View Reports', 'Export to File', 'Campaign Full Statistics', and 'Campaign Basic Statistics'.

**Solution use case 1:** You create a view-only account (1) in "settings/users" and assign this account to your customer. As soon as you create a campaign, you will be asked to enter the customer of the campaign (2). The customer can be yourself, an organizational unit or a third party. Next, you should add the user to the campaign (3). You can then assign the rights to view the statistics to the user (4).

**Use case 2:** You have a customer who wants to create their own campaigns. However, the customer should only have access to his statistics and not see other customers.

**Solution use case 2:** You create an account with the status "user" in "settings/users". Give the user only the right "Create/delete campaign" and the right to retrieve the statistics of the campaign (1). As soon as the customer logs in, he can then create his campaign and see only the data of the campaigns he created himself (regardless of the assignment of the customer). However, there are areas where this limited administrator has access to possibly sensitive data of other customers. Examples are custom created templates that may contain customer-related information. But also all recipient groups created on the system can be seen by this customer when assigning recipients.
