

How to track users watching an awareness video

Method 1: using the quiz checkbox

This method allows you only to verify, if the video was played. It does not allow tracking of the video length. Please use method 2 to track more details.

- Mark the awareness template or website as "Quiz"

The screenshot shows the configuration page for an 'Email Security Course (Version 2.1)'. On the left, there are tabs for 'Edit', 'Content Template', and 'E-mail Template', along with a 'Quick Tips' section. The main form has the following fields:

- Name:** Email Security Course (Version 2.1)
- Languages:** A list of languages (Dutch, English, Italian, Spanish, Turkish) with a '+ Add' button.
- Icon:** A search bar with a 'Durchsuchen...' button and a selected icon of an email security course.
- Description:** A text area containing information about the course duration and audience.
- Quiz:** A checkbox labeled 'Quiz' with a red box around it and a red arrow pointing to it.
- Save:** A blue button at the bottom.

- Make sure your awareness website (or template) has the quiz-question-titles.js static file with the following content: {"1": "Video Played"}
- Add "onload" attribute to body tag of HTML content, so you get the following:

```
<body onload="lucyQuizStart();">
```

- Add "onplay" attribute to video tag of HTML, so you get the following:

```
<video onplay="lucyQuizAnswer(1,1);">
```

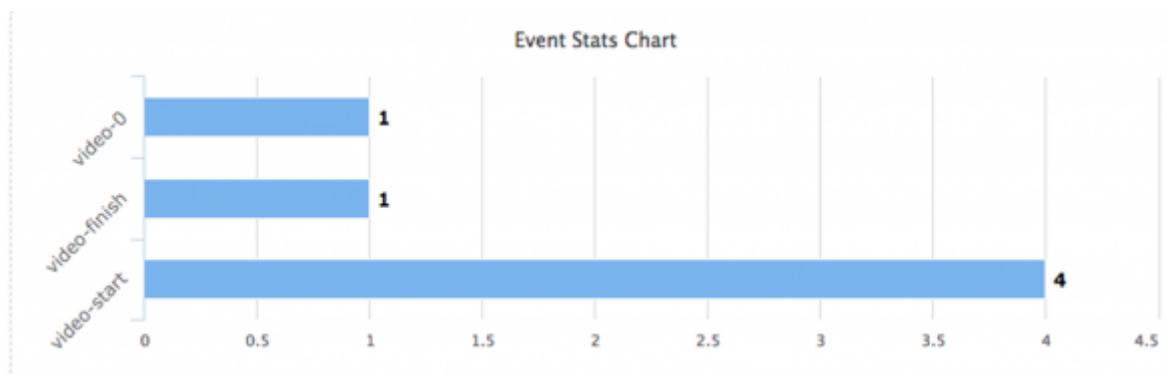

Method 2: using the video tracking JavaScript

Using our custom tracking JavaScript which can be downloaded [here](#), allows you to track video's played in LUCY's "flowplayer" which are used for all our video templates. The JS should be inserted into the bottom of the page where the flowplayer video is uploaded (please dont forget to add the script tag <script> at the beginning of the script and </script> at the end of the script:

The screenshot shows the Lucy Security video tracking interface. On the left, there are buttons for 'Edit', 'Content Template', and 'E-mail Template'. Below these are 'Quick Tips' including 'Awareness Website Variables', 'Quiz Integration', and 'Create Custom Video'. The main area is the 'Content' editor, which has a 'Language' dropdown set to 'English' and a 'File' dropdown set to 'index.html'. The 'Content' field is highlighted with a red box, and a red arrow points to the JavaScript script within it. The script is as follows:

```
<!DOCTYPE html>
<html lang="en">
<head>
  <title>Training Video</title>
  <meta charset="UTF-8" />
  <link href="/admin/settings/awareness-template/73/content/11/file/flowplayer/
skin/functional.css" rel="stylesheet" /><script src="/admin/settings/awareness-temp
te/73/content/11/file/jquery.js"></script><script src="/admin/settings/awareness-temp
late/73/content/11/file/flowplayer/flowplayer.min.js"></script>
</head>
<body>
<div class="flowplayer">
<video><source src="/admin/settings/awareness-template/73/content/11/file/video.webm"
type="video/webm" /> <source src="/admin/settings/awareness-template/73/content/11/f
ile/video.mp4" type="video/mp4" /></video>
</div>
<script>
$(function () {
  var started = false;
  var played = 0;
  var videoLength = 0;
  var finished = false;
```

This script allows you to track a video start and finish event and also display the progress in statistics (rounded percent in different event types like video-10 for 10% video played or video-90 for 90% video played, etc.). When the video is started, it sends a "video-start" event. When the video is finished (played to the end), it sends a "video-finish" event to LUCY which leads to statistics like in this graphic:
